## The M3-Competition: results, conclusions and implications

Spyros Makridakis, Michèle Hibon\*

INSEAD, Boulevard de Constance, 77305 Fontainebleau, France

---

### Abstract

This paper describes the M3-Competition, the latest of the M-Competitions. It explains the reasons for conducting the competition and summarizes its results and conclusions. In addition, the paper compares such results/conclusions with those of the previous two M-Competitions as well as with those of other major empirical studies. Finally, the implications of these results and conclusions are considered, their consequences for both the theory and practice of forecasting are explored and directions for future research are contemplated. © 2000 Elsevier Science B.V. ## Examples for time series

- lag correlation
- size and direction of trend
- strength of seasonality
- timing of peak seasonality
- spectral entropy

Called “features” in the machine learning literature.

# An STL decomposition: N2096

$$Y_t = S_t + T_t + R_t$$

$S_t$  is periodic with mean 0

# Candidate features

## STL decomposition

$$Y_t = S_t + T_t + R_t$$

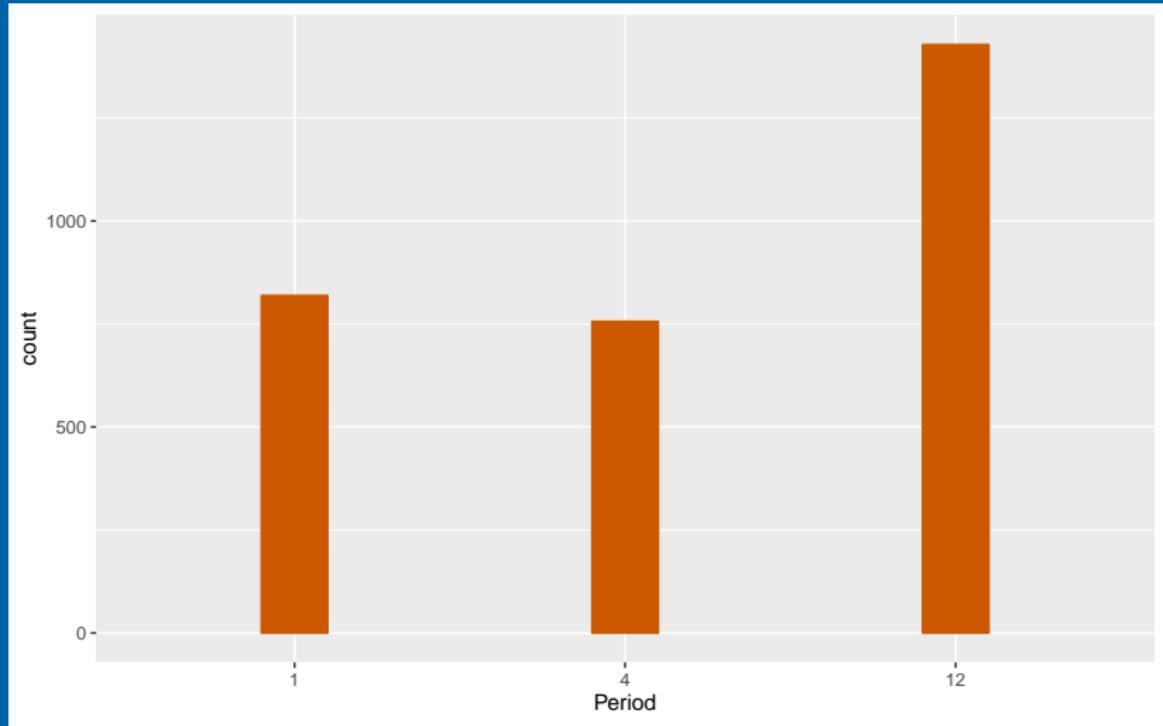

# Candidate features

## STL decomposition

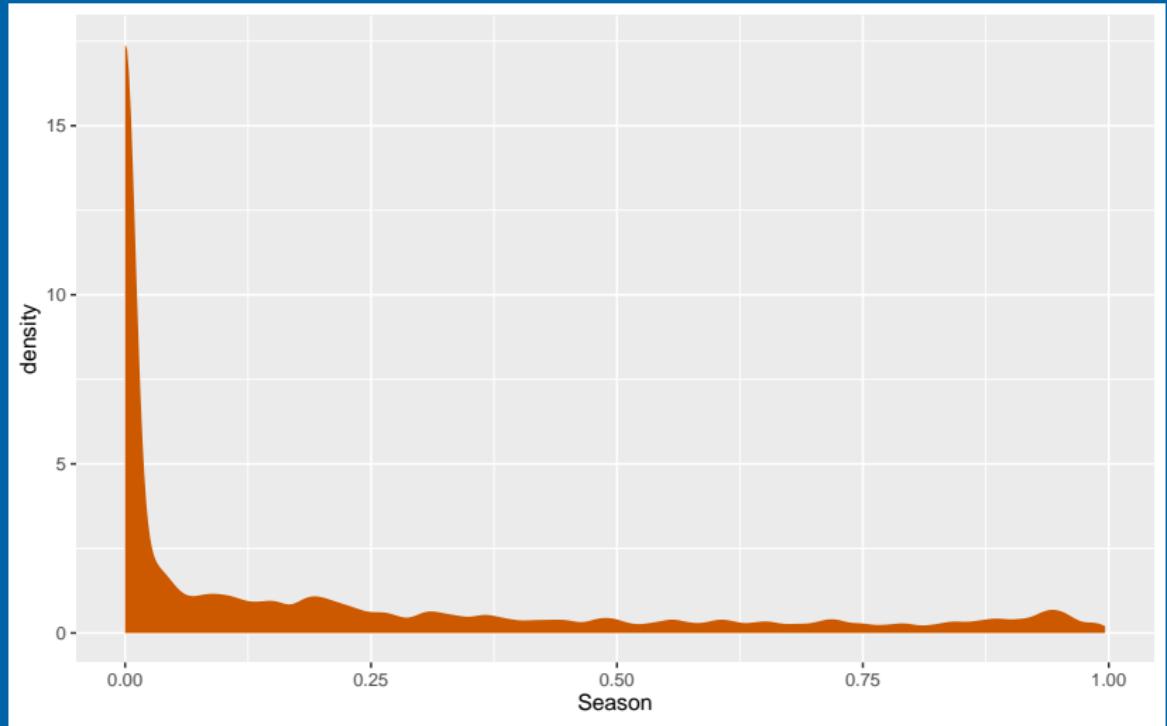

$$Y_t = S_t + T_t + R_t$$

- Seasonal period
- Autocorrelations of data  $(Y_1, \dots, Y_T)$
- Autocorrelations of data  $(R_1, \dots, R_T)$
- Strength of seasonality:  $\max \left( 0, 1 - \frac{\text{Var}(R_t)}{\text{Var}(Y_t - T_t)} \right)$
- Strength of trend:  $\max \left( 0, 1 - \frac{\text{Var}(R_t)}{\text{Var}(Y_t - S_t)} \right)$
- Spectral entropy:  $H = - \int_{-\pi}^{\pi} f_y(\lambda) \log f_y(\lambda) d\lambda$ ,  
where  $f_y(\lambda)$  is spectral density of  $Y_t$ .  
Low values of  $H$  suggest a time series that is  
easier to forecast (more signal).
- Optimal Box-Cox transformation of data

## M3 feature space

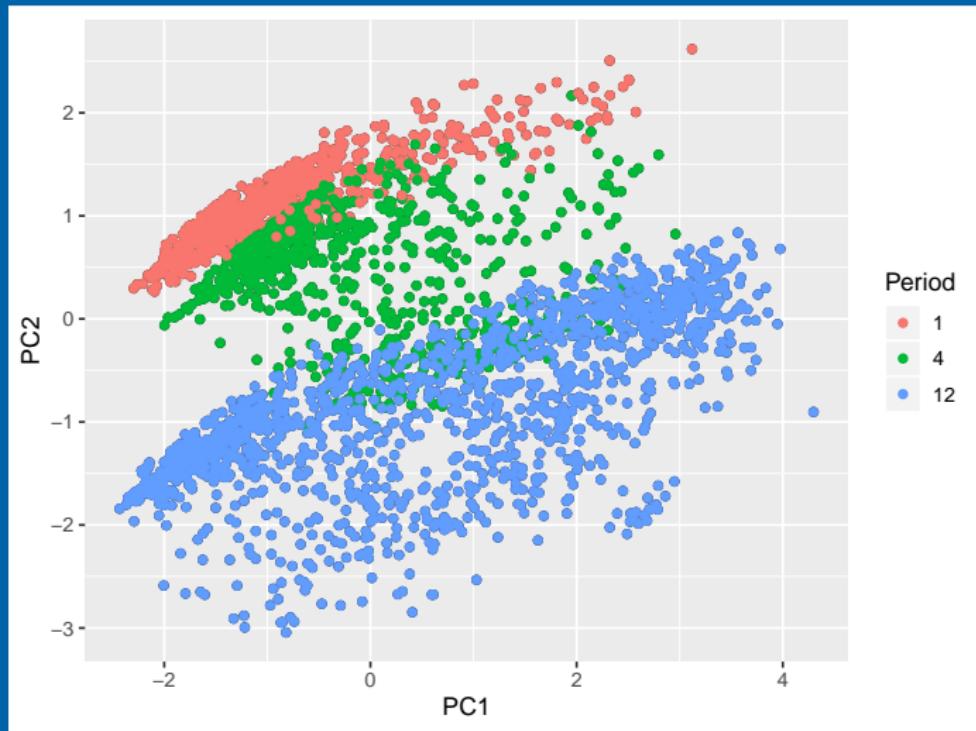

First two PCs explain  
58.5% of the variance.

# M3 feature space

# M3 feature space

## Feature properties

In this analysis, we have restricted features to be

- ergodic
- scale-independent

For other analyses, it may be appropriate to have different requirements.

# R package: tsfeatures

[github.com/robjhyndman/tsfeatures](https://github.com/robjhyndman/tsfeatures)

```
library(tsfeatures)
library(tidyverse)
library(forecast)

myfeatures <- function(x,...) {
  lambda <- BoxCox.lambda(x, lower=0, upper=1, method='loglik')
  y <- BoxCox(x, lambda)
  c(stl_features(y,s.window='periodic', robust=TRUE, ...),
    lambda=lambda)
}
M3Features <- bind_cols(
  tsfeatures(M3data, c("frequency", "entropy")),
  tsfeatures(M3data, "myfeatures", scale=FALSE))
```

# Forecast model selection

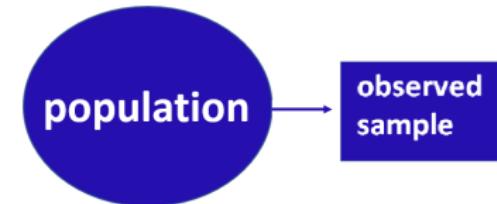

## Features used to select a forecasting model

- length
- strength of seasonality
- strength of trend
- linearity
- curvature
- spikiness
- stability
- lumpiness
- first ACF value of remainder series
- parameter estimates of Holt's linear trend method
- spectral entropy
- Hurst exponent
- nonlinearity
- parameter estimates of Holt-Winters' additive method
- unit root test statistics
- first ACF value of residual series of linear trend model
- ACF and PACF based features
  - calculated on both the raw and differenced series

# Application to M competition data

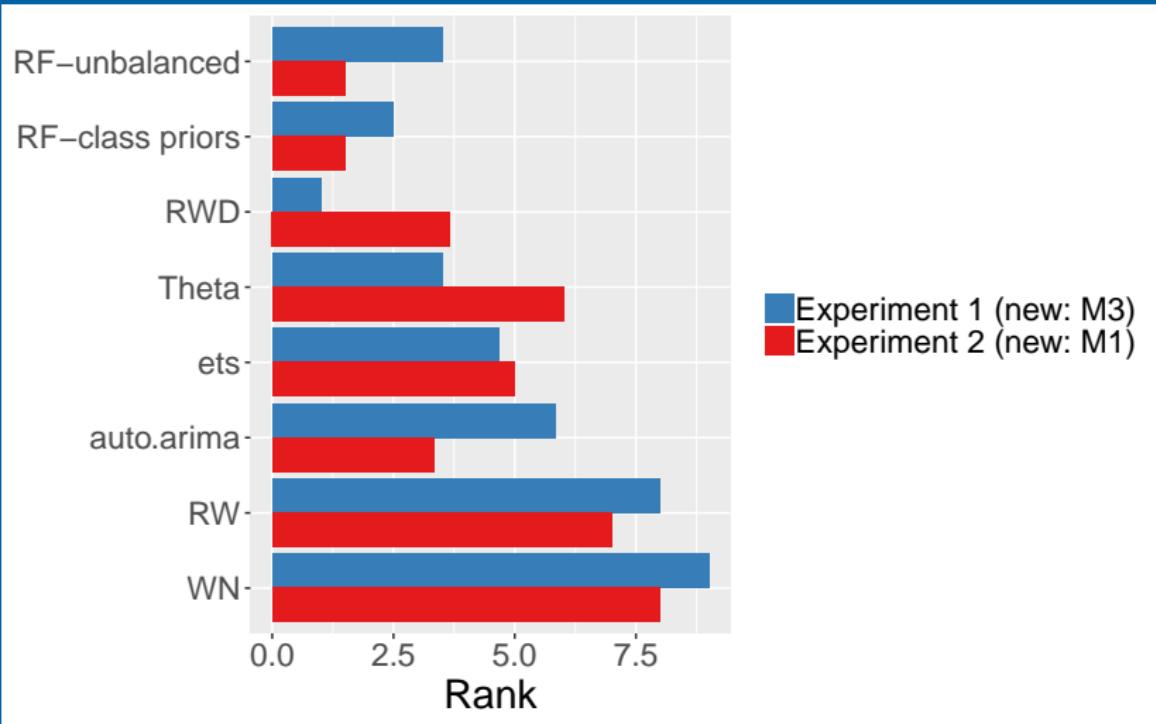

## Experiment 1

Source	Y	Q	M
Observed series	M1	181	203
Simulated series		362000	406000
New series	M3	645	756
			123400
			1428

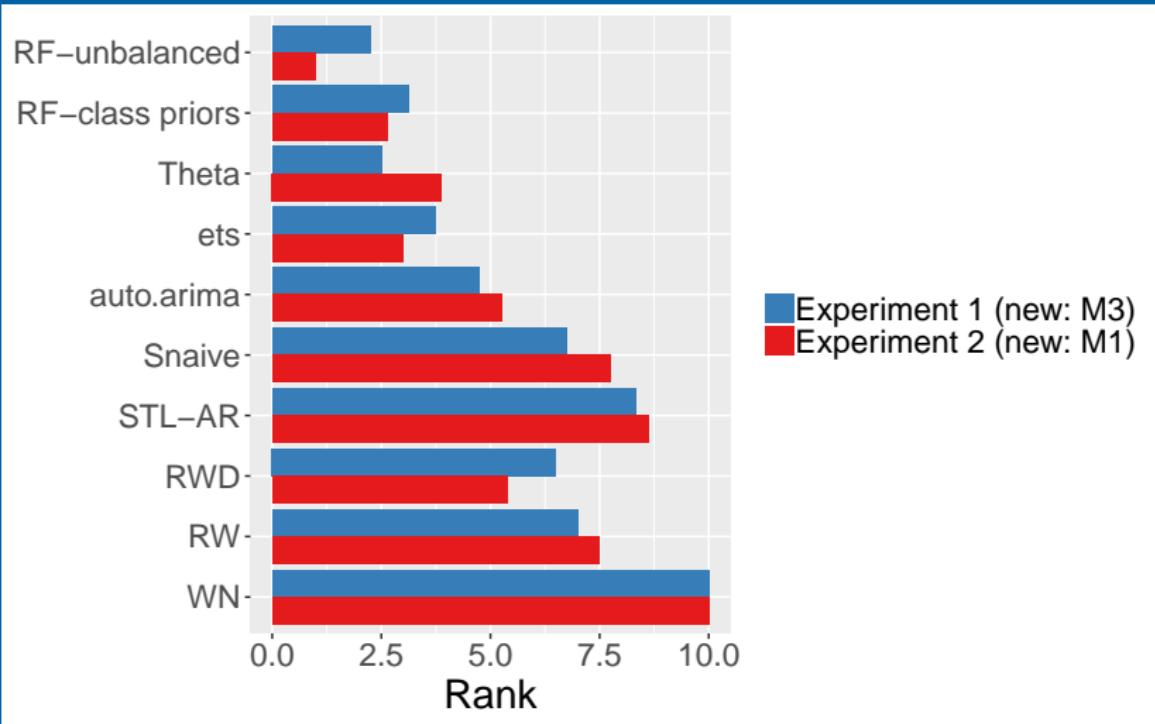

## Experiment 2

Source	Y	Q	M
Observed series	M3	645	756
Simulated series		1290000	1512000
New series	M1	181	203
			285600
			1428

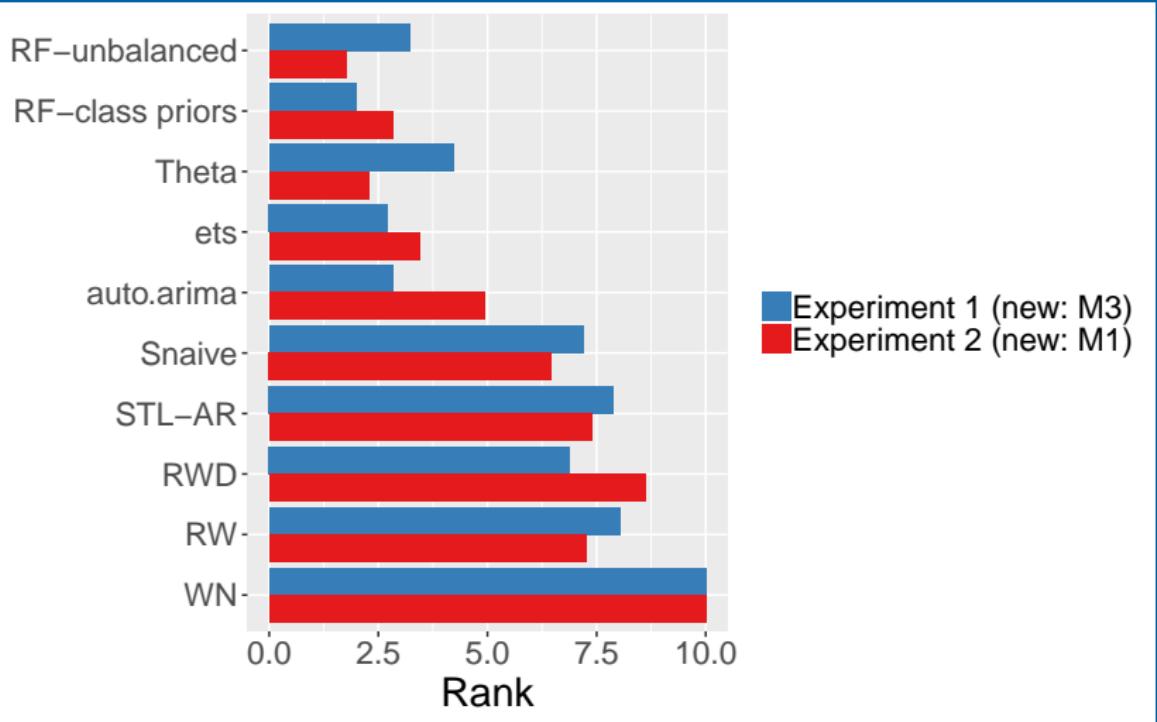

# Results: Yearly

# Results: Quarterly

# Results: Monthly

## FFORMA: Feature-based FOrecast Model Averaging

- Like FFORMS but we use xgboost rather than a random forest.
- The optimization criterion is forecast accuracy not classification accuracy.
- The probability of each model being best is used to construct a model weight.
- A combination forecast is produced using these weights.
- **Came second in the M4 competition**

# FFORMA: Feature-based FOrecast Model Averaging

## Models included

- 1 Naive
- 2 Seasonal naive
- 3 Random walk with drift
- 4 Theta method
- 5 ARIMA
- 6 ETS
- 7 TBATS
- 8 STLM-AR

# R Packages

- **seer**: FFORMS — selecting forecasting model using features.

# Yahoo server metrics

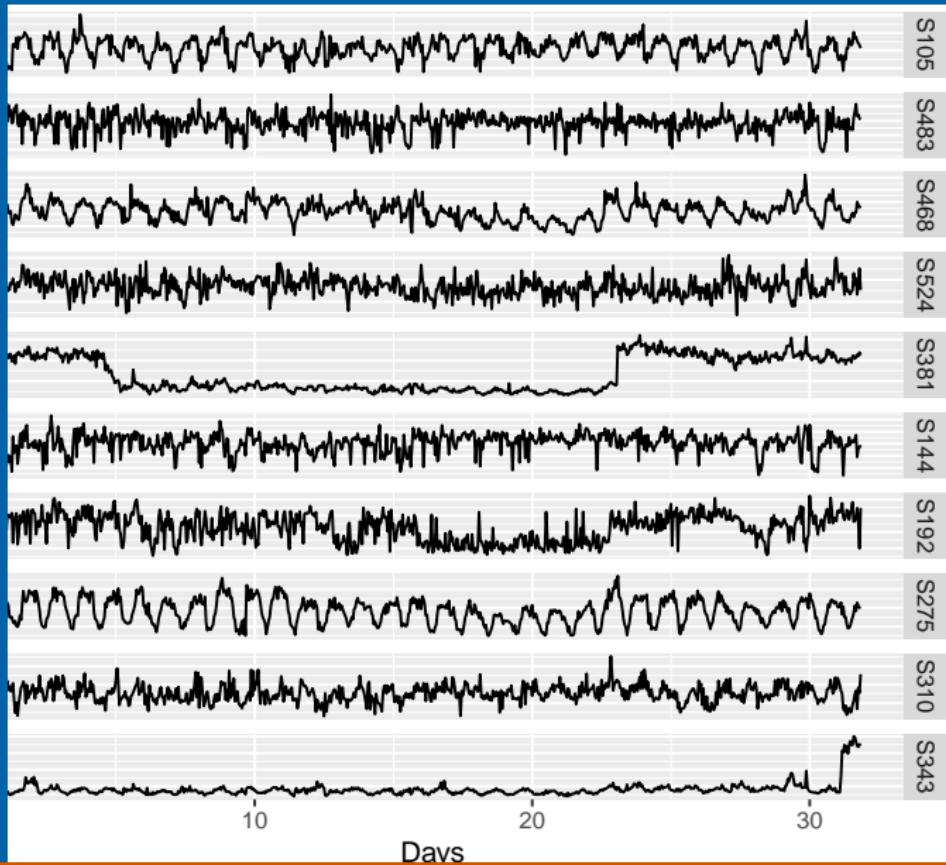

- Tens of thousands of time series collected at one-hour intervals over 1-2 months.
- Consisting of several server metrics (e.g. CPU usage and paging views) from many server farms globally.
- Aim: find unusual (anomalous) time series.

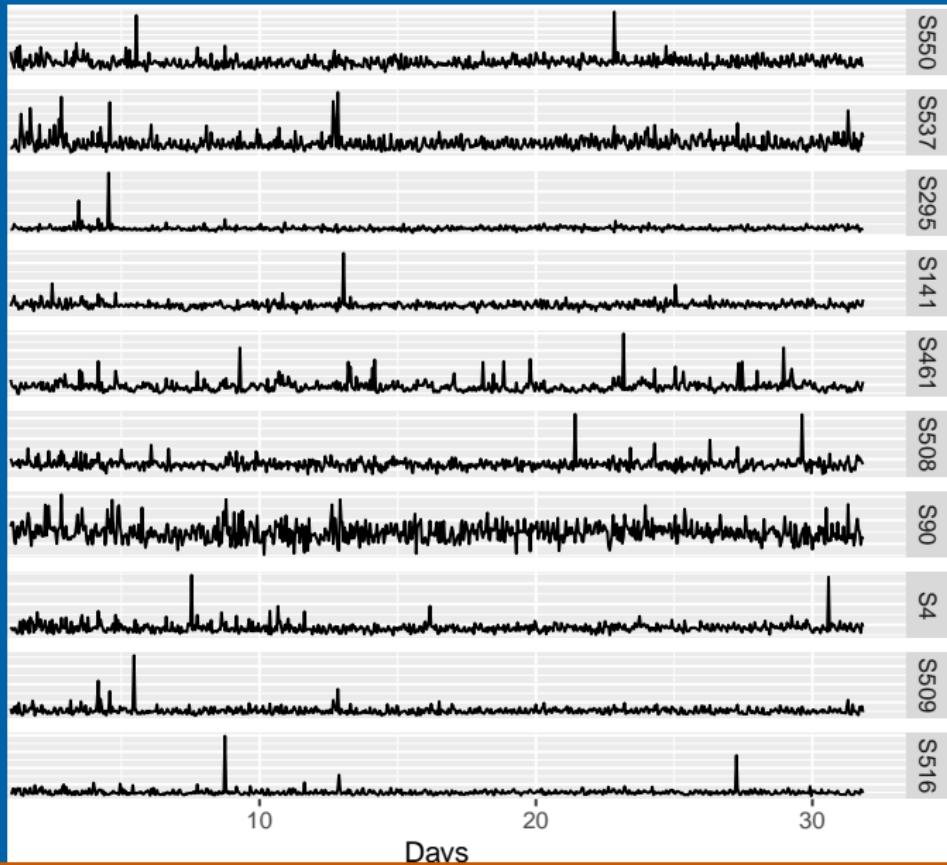

# Yahoo server metrics

# Yahoo server metrics

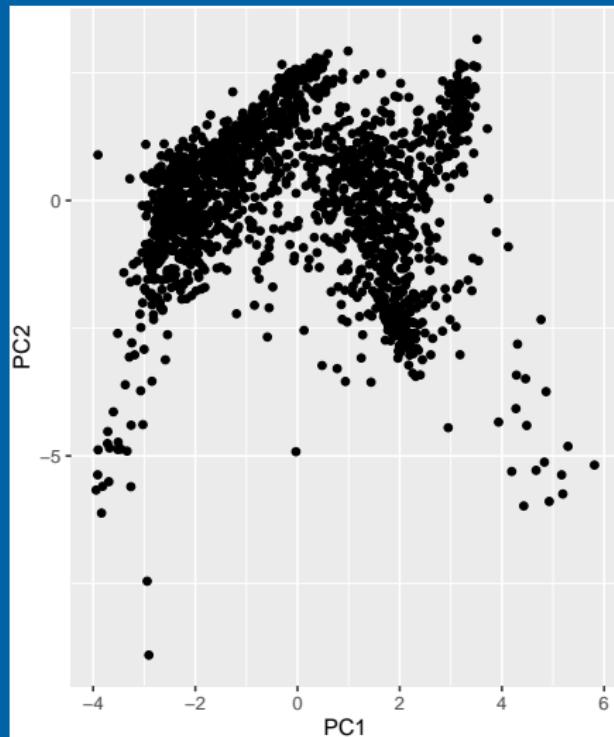

# Yahoo server metrics

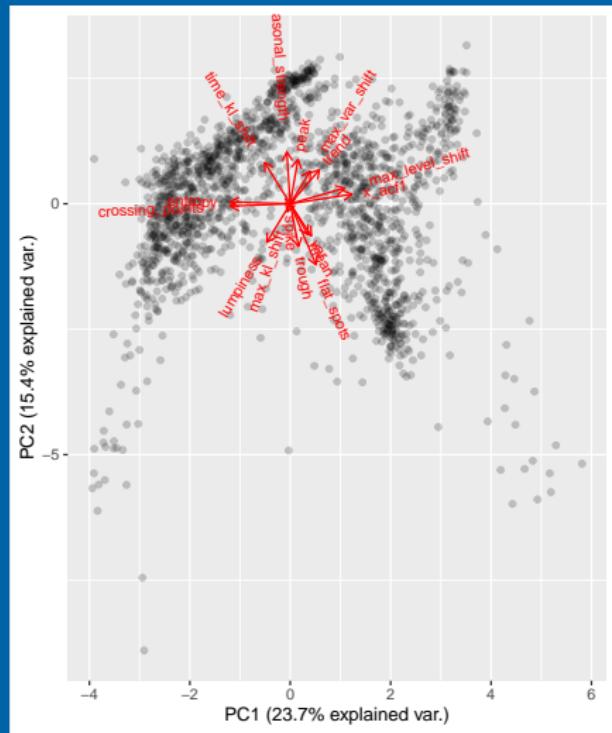

# Yahoo server metrics

- **ACF1:** first order autocorrelation =  $\text{Corr}(Y_t, Y_{t-1})$
- Strength of **trend** and **seasonality** based on STL
- Size of seasonal **peak** and **trough**
- Spectral **entropy**
- **Lumpiness:** variance of block variances (block size 24).
- **Spikiness:** variances of leave-one-out variances of STL remainders.
- **Level shift:** Maximum difference in trimmed means of consecutive moving windows of size 24.
- **Variance change:** Max difference in variances of consecutive moving windows of size 24.
- **Flat spots:** Discretize sample space into 10 equal-sized intervals. Find max run length in any interval.
- Number of **crossing points** of mean line.
- **Kullback-Leibler score:** Maximum of  $D_{KL}(P||Q) = \int P(x) \ln P(x)/Q(x)dx$  where  $P$  and  $Q$  are estimated by kernel density estimators applied to consecutive windows

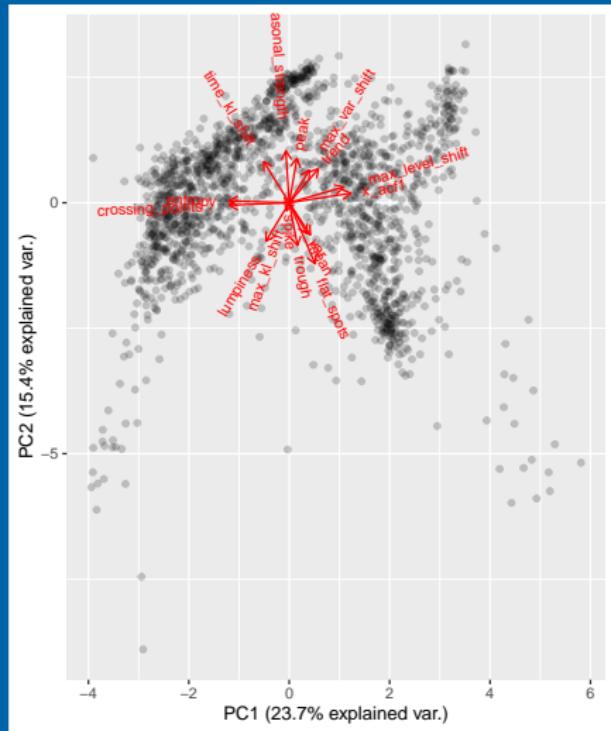

# Feature space

# Feature space

# Feature space

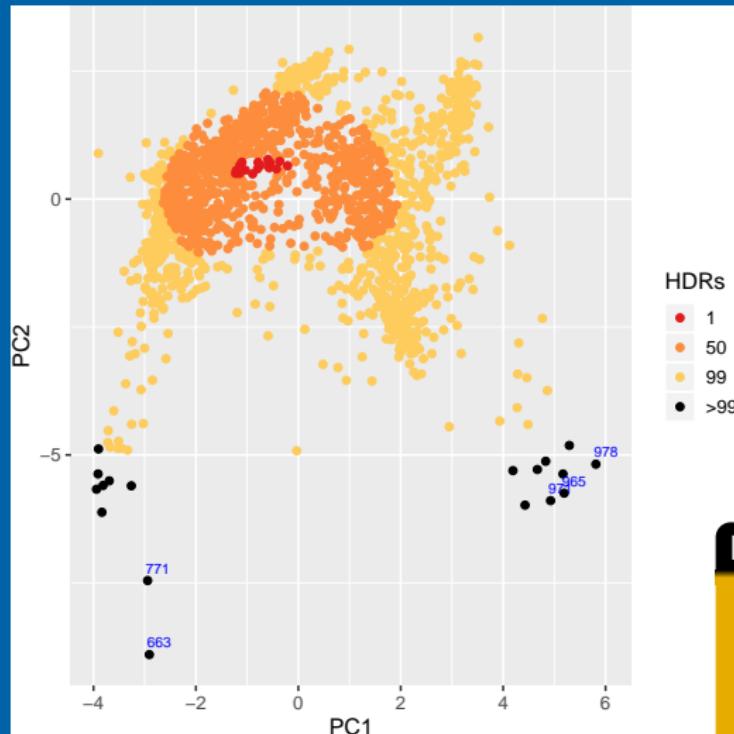

## What is “anomalous”?

- We need a measure of the “anomalousness” of a time series.
- Rank points based on their local density using a bivariate kernel density estimate.

# Finding weird time series

```
hdrcde::hdrscatterplot(pc[,1], pc[,2], noutliers=5)
```

## Highest Density Regions

- Estimate using `hdrcde` package
- Highlight outlying points as those with lowest density.

# Packages

- **hdrcde**: scatterplots with bivariate HDRs.  
CRAN | [github.com/robjhyndman/hdrcde](https://github.com/robjhyndman/hdrcde)
- **stray**: finding outliers in high dimensions.  
[github.com/pridiltal/stray](https://github.com/pridiltal/stray)
- **oddstream**: finding outliers in streaming data.  
[github.com/pridiltal/oddstream](https://github.com/pridiltal/oddstream)
- **anomalous**: yahoo data.  
[github.com/robjhyndman/anomalous](https://github.com/robjhyndman/anomalous)
